INTRODUCING THE

C71P.AI

INTELLIGENT COMPRESSION HYDRANT

POWERED BY DIGITAL WATER SOLUTIONS

Understand your water distribution system

Find leaks when they start

Monitor system pressure

Identify transient events

Reduce water loss

THE DEVICE

The C71P.AI Hydrant measures pressure, monitors for transient events, captures acoustics for leak detection, and captures water temperature in your water distribution system.

Our patented leak detection technology, proven to work in all pipe materials including plastic pipe, uses AI to transform the way you monitor your water distribution network for developing leaks and system events.

The Device is also available as a retrofit for our existing hydrants, no need to replace a hydrant to gain the benefits of the solution.

THE PLATFORM

The hydrant.AI Platform provides real-time information to utilities as conditions within the distribution system change, capturing transient events and water leaks as they develop. Providing real-time alerts to the operations team of events as they occur, allowing for better allocation of resources and reduction in water loss.

Our Platform can help make your water distribution network easy to monitor.
